

Licensing of data-sets

For planning, resource evaluation, and other activities

by Jean Alexander, *Keyworth*

The geological map, with the wealth of information it contains, is a key resource for parties involved in a variety of strategic undertakings. Issues like planning, sustainable development of natural resources, mineral extraction, aquifer vulnerability, potentially contaminated land, environmental site assessments, water resource evaluation, subsidence, and other potential geohazards affecting parcels of land for development, all require a geological input. Decision-making processes can be assisted by the use of one or more different types of primary geological, hydrogeological, geochemical, geophysical, and engineering geology data-sets, in analogue or electronic form.

Copyright of BGS materials

The copyright of materials derived from the British Geological Survey's work is vested in the Natural Environment Research Council (NERC). No part of these materials (geological maps, charts, plans, diagrams, graphs, cross-sections, figures, sketch maps, tables, photographs, data-sets in electronic or analogue forms) may be reproduced or transmitted in any form or by any means, or stored in a retrieval system of any nature, without the prior written permission of the copyright holder.

The BGS's multidisciplinary investigations ensure continual data collection and the growth of 'know-how', which is manifest in new interpretations of environmental materials, tailored to assist with problem solving. Such key materials and associated expertise are increasingly in demand by different sectors of the community. They are also copyright protected, and their employment by external parties is subject to licensing arrangements.

Licensing arrangements

Under the Copyright Designs & Patent Act 1988, obtaining permission is not optional, copyright compliance is mandatory. Consent to reproduce BGS materials is normally supplied under a licence or permit, for which appropriate fees are levied, discounted, or waived. Like other science-based organisations, the BGS is keen to promote business with commercial organisations, government departments and agencies, local authorities, the utilities, research establishments, universities, professional organisations, individuals, and educational concerns, who wish to create products, or provide services based on the BGS's materials.

To ensure that copyright infringements do not arise, permission has to be obtained from the copyright owner(s). In the case of BGS maps this includes both BGS and the Ordnance Survey (OS). Most of the BGS's geological maps make use of OS topography, which is Crown Copyright, and the reproduction of which is granted via an OS licence. Crown Copyright (and that of other

Types of licences

Both analogue and digital licences are available. The digital ones cover the provision of raster and vector data in a range of export formats. A licence does not always imply a fee, but it always confers usage subject to particular terms and conditions. Copyright is not transferred to external parties in possession of a BGS licence.

- Digital data-set (commercial, local authorities, national bodies, Government Departments).
- Academic/educational (universities, individual students, etc. for non-commercial usage).
- Demonstration (use of single set digital data for display purposes only).
- Self-digitising (issued when the BGS does not possess digital data).
- Composite (covers other types of digital data under one licence).
- Complementary (covers the use by consultants, working on behalf of the licensee, of digital material for the purposes of fulfilling contractual obligations).
- Corporate (licenses different premises on a country-wide basis).
- Service level agreements (SLAs) — under development.
- VARs (Value Added Resellers — special royalty-based arrangements enabling the incorporation of BGS digital data into products and services generated to service the needs of specific industry sectors).

copyright proprietors) is acknowledged on geological maps, materials, and other publications. Reproduction of OS materials contained within the BGS's maps may be independently permitted by the licences issued by the OS. Users who do not have an OS licence to reproduce the topography must make their own arrangements with the OS. An OS licence does not authorise the reproduction of BGS maps; likewise a BGS licence does not authorise the reproduction of OS material.

T Cullen, BGS © NERC

An example of a key resource; a collage of maps covering the British Isles and adjacent areas, (1:250 000 scale).

With the exception of confidential holdings, BGS-approved digital data-sets are available for use by external parties. These are leased under a non-exclusive licence, which is renewable on an annual basis and payment of appropriate fees. Special arrangements for corporate/multi-site usage are available. Under the terms and conditions of a BGS digital licence, the licensee is provided with up-dates of the particular geoscientific data-sets as

and when they become available. The licensee is not permitted to use the data to provide a bureau service for others, or to undertake any self-digitisation of BGS materials. Where individuals have proceeded with their own scanning or digitisation of BGS's maps, they may be in breach of NERC copyright (and that of the OS). Such parties are advised to contact the independent copyright owners to remedy the situation.

Advantages of using authorised data-sets

The advantage of licensing is that licensees can be confident of the provenance, integrity, and currency of the materials involved. This is important to commercial enterprises where liability issues arising from the use of inappropriate materials have severe financial implications for a business. Likewise, the provision of up-to-date information by statutory bodies involved in planning for the sustainable development of natural resources, is heavily reliant upon the currency and appropriateness of the environmental data-sets used. The employment of licensed digital materials ensures the receipt of information that is 'fit-for purpose', with advice from those best qualified to provide it, supplemented with long-term experience in data collection, processing, interpretation, integration with other data-sets, delivery, and environmental data management.

Contact Details

Anyone wishing to employ BGS materials should initially discuss their requirements, with BGS Intellectual Property Rights (IPR) staff. Permission must be sought in writing (letter, fax, or e-mail), from the Intellectual Property Rights Manager, Dr J Alexander, British Geological Survey, Kingsley Dunham Centre, Keyworth, Nottingham, NG12 5GG.

- Dr Jean Alexander, for IPR advice, VARs, Corporate Licences, SLAs.
Tel: +44 (0)115 936 3331.
Fax: +44 (0)115 936 3615.
e-mail: jalex@bgs.ac.uk
- Mrs Rachael Baines, for digital licencing enquiries.
Tel: +44 (0)115 936 3126.
e-mail: rbai@bgs.ac.uk
- Mr Robert Crosby, for copyright enquiries.
Tel: +44 (0)115 936 3009.
e-mail: rocr@bgs.ac.uk
- Mr Roger Parnaby, digital data technical contact, for information about the availability of digital geological map data.
