BRITISH GEOLOGICAL SURVEY

The full range of Survey publications is available from the BGS Sales Desks at Nottingham, Edinburgh and London; see contact details below or shop online at www.geologyshop.com. The London Office also maintains a reference collection of BGS publications including maps for consultation. The Survey publishes an annual catalogue of its maps and other publications; this catalogue is available from any of the BGS Sales Desks.

The British Geological Survey carries out the geological survey of Great Britain and Northern Ireland (the latter is an agency service for the government of Northern Ireland), and of the surrounding continental shelf, as well as its basic research projects. It also undertakes programmes of British technical aid in geology in developing countries as arranged by the Department for International Development and other agencies. The British Geological Survey is a component body of the Natural Environment Research Council.

ACKNOWLEDGEMENTS

The authors would like to acknowledge the assistance they have received from the many organisations and individuals contacted during the compilation of this volume. In particular, thanks are due to our colleagues at BGS for their assistance during revisions of particular areas, the mineral planning officers at the various local authorities, The Coal Authority, and to the many companies working in the Minerals Industry.

EXCLUSION OF WARRANTY

Use by recipients of information provided by the BGS is at the recipients’ own risk. BGS has taken care to ensure that information provided is as free from error as is reasonably practical. In view of the disparate sources of information at BGS’s disposal, including such material donated to BGS, that BGS accepts in good faith as being accurate, the Natural Environment Research Council (NERC) gives no warranty, expressed or implied, as to the quality, accuracy, performance, and merchantability of the information supplied, or to the information’s suitability for any use whether made known to BGS or otherwise. NERC/BGS accepts no liability whatever in respect of loss, damage, injury or other occurrence however caused.

**Part 2**

List of mineral operators by Minerals Planning Authority (MPA)

**Part 3**

Alphabetical list of operators
INTRODUCTION

Sources of Information

This edition of the Directory of Mines and Quarries, in addition to being published in hard copy format, is available as a download from the MineralsUK.com website of the British Geological Survey (BGS). The data on which the Directory is based are held digitally in the BGS mineral workings database BRITPITS, and a digital licence for its use can be obtained from the BGS.

The first quarry list produced by the BGS and its predecessors was the Mineral Statistics of the United Kingdom of Great Britain and Ireland for the year 1858, Part II. Embracing Clays, Bricks, &c., Building and Other Stones with Sundry Earthy Minerals. In this, along with the statistical information, Roderick Murchison stated in his foreword that ‘The present publication is the result of a first attempt on the part of Mr Robert Hunt to collect returns of the produce of the Clay Works and Quarries of the United Kingdom’. One objective of the volume was to record the building stone quarries operating at the time, and some continuity exists between that volume and this, with some of the sites still being recorded (see Figure 1, in which, albeit with a slightly unique and possibly phonetic spelling, Locharbridge is found – this being listed as Locharbriggs in the current edition). Hunt had the luxury of time to include such information on the properties as density – given as ‘Avoirdupois Weight per Cubic Foot’, obviously useful for building stones or slates. Where he could, Hunt gave the ‘Prices of Stone at Quarry’. Occasional footnotes give colours and other information on the method of quarrying.

Some of the information being collected is still the same – Geological Formation, operator, end use and location (the later equivalent of ‘Nearest Railway Station or Shipping Port’) – but other information is no longer collected as an individual quarry’s annual production, for example, is now commercially sensitive. Information on which buildings were supplied by which building stone quarry was collected during the English Heritage-funded Strategic Stone Study and is available through the BGS MineralsUK.com webpages.

The information gathered for each edition was used only in the production of that Directory, with the result that the information on any site where extraction had ceased was lost. By the late 1990s, however, it was clear that BGS needed to keep details of the ceased and inactive mineral workings. This was partly because of the importance of former workings for waste disposal, amenity and nature conservation (Sites of Special Scientific Interest etc.), but was also driven by the requirement of central government’s then Department of the Environment (DoE, and its subsequent identities) to assist with the preparation of mineral planning policy and in the calculation of the amounts of aggregates being produced across the country. With a further emphasis being placed on resources, there was a need to know where extraction had occurred in the past, and therefore where resources were depleted. An Oracle database called BRITPITS (British Pits) was developed, with a Microsoft Access front end, to enable the relevant data to be stored, i.e. the operator, location, the material worked, the commodity produced and what its end use might be. By 2000, the BRITPITS database had been populated with approximately 6000 records, based primarily on those that had featured in past editions of the Directory.

Since then, there has been a concerted effort to complete a baseline database of mineral workings in the UK, and there have been several commissioned projects which have required this sort of information to be collected. These have included the Mineral Resource Information in Support of National, Regional and Local Planning project (‘County mineral resource maps’), required in advance of the creation of Unitary planning authorities from the former Metropolitan and County councils.

Figure 1  An extract from Hunt’s 1858 listing of Quarry Returns.

The information gathered for each edition was used only in the production of that Directory, with the result that the information on any site where extraction had ceased was lost. By the late 1990s, however, it was clear that BGS needed to keep details of the ceased and inactive mineral workings. This was partly because of the importance of former workings for waste disposal, amenity and nature conservation (Sites of Special Scientific Interest etc.), but was also driven by the requirement of central government’s then Department of the Environment (DoE, and its subsequent identities) to assist with the preparation of mineral planning policy and in the calculation of the amounts of aggregates being produced across the country. With a further emphasis being placed on resources, there was a need to know where extraction had occurred in the past, and therefore where resources were depleted. An Oracle database called BRITPITS (British Pits) was developed, with a Microsoft Access front end, to enable the relevant data to be stored, i.e. the operator, location, the material worked, the commodity produced and what its end use might be. By 2000, the BRITPITS database had been populated with approximately 6000 records, based primarily on those that had featured in past editions of the Directory.

Since then, there has been a concerted effort to complete a baseline database of mineral workings in the UK, and there have been several commissioned projects which have required this sort of information to be collected. These have included the Mineral Resource Information in Support of National, Regional and Local Planning project (‘County mineral resource maps’), required in advance of the creation of Unitary planning authorities from the former Metropolitan and County councils.
This work was completed in early 2006 and a series of digitally generated maps at a scale of 1:100 000 are available as a result. These maps cover 44 administrative areas or groups of administrative areas and encompass the whole of England and parts of South Wales. The four major elements of information presented on the summary maps are: the geological distribution of all onshore mineral resources, the location of mineral extraction sites, the extent of mineral planning permissions and licences for coal extraction, and the extent of selected landscape and nature-conservation designations (National Parks, AONBs, SSSIs, NNRs and Scheduled Monuments). All are available for download from the MineralsUK website at [http://www.bgs.ac.uk/mineralsuk/planning/resource.html](http://www.bgs.ac.uk/mineralsuk/planning/resource.html).

Use of the spatial information provided by this project greatly assisted both the updating of the BRITPITS database and the Directory itself. A subsequent commission from English Heritage to help identify and collect information on building stone sources in England also led to a major increase in the number of records held by BGS.

The production of this edition has been assisted by the Department for Communities and Local Government (DCLG), the Scottish Government and the Welsh Assembly Government. Much of the data herein presented are based on that collected during the Annual Minerals Raised Inquiry (AMRI) pre-survey of Minerals Planning Authorities for the Office for National Statistics (ONS) and the three government organisations. In addition, certain mineral operators have been contacted during 2014, thereby giving them the opportunity to update the information held by BGS in the BRITPITS database concerning operational status, commodities worked and their end use products.

**The Minerals industry**

Since the last edition, there have been a number of changes to the minerals industry in Britain, most notably in the aggregates sector with the merging of the assets of Lafarge and Tarmac, and the consequent disposal of some of these assets to a new company, Hope Construction Materials. Also in the aggregates sector, Breedon have acquired the Scottish assets of Aggregate Industries as well as other companies in England and Wales, making them one of the larger independent companies.

It was thought that fluorspar production in the UK would cease by 2011, however, despite closure for a short time, production of fluorspar has recommenced at Milldam Mine and the open works in the Peak District by British Fluorspar Ltd.

Another commodity, Tungsten, is now making a return to the Directory as development of the open pit and construction of the associated production plant are well underway at Hemerdon, Devon, where Wolf Minerals (UK) will extract the mineral (with operations likely to begin in 2015).

In Northern Ireland, there are a number of additional commodity terms in use: Basalt, Dolomite, Gritstone, Shale and Schist. These are included in this edition for the first time in order to allow the Northern Irish quarry commodities to mirror the producers’ terminology.

*Including offshore production*

Information given

The Directory is derived from a database (BRITPITS) which contains over 2000 entries pertaining to active mineral workings and a much larger number for inactive and former workings, totalling 193470 entries. Each entry in the Directory describes an individual onshore mineral working in terms of its name, geographic location, Mineral Planning Authority (MPA), operator, basic geology, mineral produced and, where known, the end-use of that mineral. In addition, there is a list of mineral workings by MPA, and an alphabetically arranged list of company addresses. These include rail depots and wharves for landing of marine-dredged sand & gravel and crushed rock aggregates; the source of these minerals is indicated where this is known. Although information from MPAs and industry sources on operational status was correct at the time of entering to the database, workings may subsequently have ceased operations, and additionally there may be new sites started in 2014, which were not reported.

The underlying digital BRITPITS database (an abbreviation of British Pits, and the word ‘pits’ is used here to include both surface quarries and underground mines) was assembled mainly from the records of BGS, MPAs, the minerals industry and various central government departments and agencies (DCLG, The Coal Authority etc.). These data are available in digital form under licence. Originally, only details of currently active and temporarily inactive sites were included in the database, but owing to the importance of former workings for waste disposal, amenity and nature conservation (Sites of Special Scientific Interest etc.), information is now collected on former operations. Further information on licencing the BRITPITS data may be found here http://www.bgs.ac.uk/products/minerals/BRITPITS.html.

While the compilers have tried to ensure that the Directory is as accurate and up-to-date as possible, any derived list of active mines and quarries is a snapshot in time and is inevitably out-of-date as soon as it is produced. Changes in ownership, shifting of the extraction location as reserves become exhausted or a new extension commences production, and the renaming of sites are regular occurrences, and all of these cause problems when attempting to maintain a definitive database. It is perhaps inevitable in a work of this kind that there will be some omissions and inaccuracies. The Directory includes sites which are worked only on an intermittent basis and some of which may be currently inactive, but which still have valid planning consents. Estate quarries and other operations that do not offer material for sale have in most cases been excluded, although these operations must still have planning permission for mineral extraction. The compilers would be pleased to hear from any operators who feel they have been inaccurately represented so that the erroneous details can be corrected in the BRITPITS database and thus in future editions of the Directory.

The operations are classified by the type of economic mineral produced, as described in terms of the standard commodity names used for mineral raw materials in BGS publications and official statistics. The commodities produced in the UK in 2014 are listed in Table 4. Dolomite is included with limestone, except for the Northern Ireland entries, although known dolomite producers are indicated where the mineral product is valued for its magnesia (MgO) content. Other commodity terms used in Northern Ireland include Basalt, Schist and Gritstone, which are included in Igneous and Metamorphic Rock and Sandstone for the rest of the UK. Shale and other clayey materials used for brick, tile, pipe- or cement-making, and for aggregate and constructional fill, are included with clay. Sand is described as ‘Silica Sand’ if it is used for industrial purposes, such as in glassmaking or for foundry use, as distinct from construction purposes, such as in concrete, mortar or asphalt. However, the distinction cannot always be defined with certainty as many operations classified under ‘Silica Sand’ may sell a proportion of their output for construction purposes and vice versa. Silica sands are increasingly being used for a variety of horticultural and recreational uses such as dressings for artificial football pitches and for golf course bunkers, where their purity is valued. Operations classified under the heading of Sand & Gravel include those producing both Sand and Gravel at the same site as well as a significant number producing Sand only. The compilers have attempted to separate those sites producing only sand from those containing gravel. Details of brine (salt) workings and land-based oil and gas wells are also included. For sites where more than one mineral commodity is known to be produced, entries have been made under each relevant commodity.

A mineral working may be known under several names – one given by its operator, one by the MPA, a traditional local one, or even one relating to the land holding on which it is situated. In the Directory, we have generally used the name currently recognised by the operator. However, the reader is cautioned against assuming that quarry names are unique or immutable. Where known, alternative names which differ greatly are given in brackets after the current name. Extensions to sites, or satellite workings, are included as separate sites where these have been reported as separate sites by the MPA or operator. In some cases, the operator may consider a number of these workings to be one site, hence only one record of the address and other contact details will be given in the appropriate parts of the Directory.

To distinguish between underground and openpit workings, the word ‘mine’ or ‘colliery’ is incorporated into the name of every underground operation. Openpit and other operations are generally named by a single term; the word ‘quarry’ is not generally used except as part of the address. Exceptions are made where it is felt that the full name confers further information on the product worked. The term ‘Opencast Coal Site’ or ‘OCCS’ has been superseded by ‘Surface Coal Mine’.
The location of each site is described with respect to the MPA within which it occurs. For underground mines, the location of the shaft determines the location, although the workings may extend into other administrative areas. Many quarries also straddle administrative boundaries, but the quarry is assigned to the administrative area in which it principally occurs and a note is made of the other Authority. A six-figure National Grid Reference defines the approximate centre of the working or shaft/adit to the nearest 100 metres. The name of a nearby town or other important geographic location is also given, although this is not necessarily part of the postal address of the site. The postal address may also show a different authority to that shown as the MPA.

The name of the operator is given for each mineral working, although this is not intended to be a definitive company title and, in the case of the larger companies, a recognised abbreviation may be used. If the operator is readily recognised as a subsidiary company, then the name of the parent company may be given first, followed by the subsidiary. Satellite pits are grouped with the main operation where this is known. If there is more than one operator on a site, or one of the commodities is taken by another operator, this is noted.

Geological details are included for each working, based on the BGS Digital 1:50 000 Geological Map. The geological information refers to the stratigraphic unit (usually formation) in which the working is believed to be principally located, and does not necessarily define the material produced at any particular time. In this context, the reader’s attention is drawn to BS812: 1984 Testing aggregates. Part 102, Methods for sampling where consumers of aggregates are cautioned against associating physical or chemical properties with geological descriptions. Quarries may work more than one geological unit simultaneously, although only the main unit is generally listed.

Sedimentary units are described primarily by their geological age and lithostratigraphy. Igneous rocks are described by name where known, or by a simple petrographic term, and the geological age is given where known. Other names are given where these are useful. Building stones may also be identified by a non-scientific commercial rock name, listed in the products, such as ‘Hard Yorkshire Sandstone’, where the quarry product is known by this term. In cases where new stratigraphical terms have been introduced, mention is made of the former name. The reader is referred to the BGS Lexicon of Named Rock Units, which can be accessed through the BGS website: www.bgs.ac.uk/lexicon/.

Mineral Planning Authorities

An authority with responsibility for planning control, including deciding planning applications, for mineral working is called a Mineral Planning Authority (MPA). In Wales, Scotland and some parts of England, the responsibility for mineral planning resides with the unitary authorities, which deal with all planning issues within the areas for which they are responsible. In those parts of England with two tiers of local government (counties and districts), MPAs are the county councils and National Park Authorities. In Scotland, the Loch Lomond and Trossachs National Park is an MPA as it has authority over local plans and development control; structure plans remain with the 4 local authorities (Argyll and Bute, Perth and Kinross, Stirling and West Dunbartonshire) from which it was formed. Cairngorms National Park is not an MPA. The unitary authorities in England include the London Boroughs and the Metropolitan Borough Councils within former Cleveland, Greater Manchester, Merseyside, South Yorkshire, Tyne and Wear, West Midlands and West Yorkshire counties, as well as a number of others around major towns in other parts of the county.

Since the last edition of the Directory in 2010, two New Minerals Planning Authorities have been formed – the New Forest National Park, functioning over parts of Hampshire and Dorset, and the South Downs National Park, covering parts of Hampshire, West and East Sussex.

In Northern Ireland, The Planning Service, an agency within the Department of the Environment, is responsible for planning. Applications for mineral extraction are handled by the Special Studies Section (Minerals Unit) based at the Planning Service HQ in Belfast, although the Directory entries are shown by county to give an indication of geographical variations.

Arrangement

In Part I of the Directory, the mineral workings are grouped primarily by the mineral commodity produced, and subsequently by the Region in which they are located, in the following order: England – East Midlands, East of England, North East, North West, South East, South West, West Midlands, Yorkshire and the Humber; Channel Islands; Isle of Man; Northern Ireland; Scotland; Wales. They are then arranged alphabetically by MPA. Within each article, the first line is the name of the quarry or mine, the second line gives a grid reference and the location, the third line specifies the operating company, and the final lines includes
geological and any other relevant details, including products where known. Quarries worked as satellites are grouped with the parent site, where this is known. An example of the data layout is shown at the start of Part 1.

The National Grid

The National Grid used in this Directory is a widely used map reference system developed by the Ordnance Survey that enables any location to be uniquely defined. The country is divided into 100 km by 100 km major grid squares, each of which is defined by means of two letters, e.g. SK represents the 100 km square 400 000 m east of origin and 300 000 m north of origin. These are further subdivided by gridlines into 1 km squares and numbered from 0 to 99 from the south-west corner in an easterly and northerly direction (these are the grid squares on 1:25 000 or 1:50 000 topographical maps). Hence in any grid reference given in the Directory, the initial letters define the major 100 km square, the next two digits the 1 km increment eastwards from an origin in the south-west corner of the major square, while the third digit is the 100 m increment within the grid square. The second trio of digits give the corresponding coordinate northwards from the same origin. Further explanation of the system, together with worked examples, can be found on the Ordnance Survey website (http://www.ordnancesurvey.co.uk/support/the-national-grid.html) and on Ordnance Survey maps, of which the Landranger Series on the scale of 1:50 000 will be found to be a useful companion to this Directory. Northern Ireland forms part of the Irish Grid and has a single letter prefix to denote 100 km major grid squares, e.g. J 236 741.

MineralsUK.com

MineralsUK is the website of the British Geological Survey’s Centre for Sustainable Mineral Development. Facilitated by the BGS Minerals and Waste science programme, the Centre is a global leader in the compilation, provision and analysis of mineral statistics, and the major UK national provider of spatial and statistical minerals information. We also carry out research in areas directly relevant to our user community, such as metallogenesis, land-use impacts of mineral extraction and geomaterials.

This website was launched in 1999 to provide information about mineral exploration, mining, quarrying, production and trade. Since then, the scope of the website has been broadened and it now includes content on a wider range of issues, such as spatial information on resources, sustainable development, planning information and UK policy and legislation. The content of this website is being continually updated as the industry, legislation and information availability evolves. Our objective is to provide users with a portal into the wide-ranging minerals-related outputs of the BGS and serve as a central focus for minerals information specifically related to the UK. Please contact us with your comments and suggestions for improving the website and to assist us in keeping it up to date. The website address is: www.mineralsUK.com.
Location of Mineral Workings

Several maps of major commodities worked in the UK and Northern Ireland are presented on the pages that follow, together with a table listing the numbers of active workings in the UK (Figures 3–8 and Table 4). Please note that more than one commodity may be produced at a single site.

The data presented here are held in the BGS BRITPITS database of UK mineral workings, together with details of over 190000 other UK mineral workings. These can be accessed digitally from http://www.bgs.ac.uk/products/minerals/BRITPITS.html.

BGS is currently engaged in a systematic survey of former mineral workings, which is intended to cover the whole of Great Britain. The extent of the data coverage by mid-2014 is shown below. The coastline in both this and the following figures is courtesy of the USGS.

![Current distribution of BRITPITS database record holdings.](image)

Figure 5  Sand & Gravel resources and workings in the UK in 2014.
Figure 6  Sandstone resources and workings in the UK in 2014.
Figure 7  Coal resources and workings in the UK in 2014.
Figure 8  Onshore Oil and Natural Gas workings in the UK in 2014.
The UK has one of the largest dredging industries in the world and marine-sourced aggregates make a vital contribution to the UK aggregate supply for construction, coastal protection and land reclamation. To date, more than 900 million tonnes of marine sands and gravels have been extracted from the UK's continental shelf and marine dredged aggregates account for about a fifth of the UK's sand and gravel production. Due to increasing pressure on onshore resources and the large quantities of material likely to be needed for infrastructure projects, this offshore demand is unlikely to decline.

Offshore sands and gravels have similar origins to their land-based equivalents and are mainly derived from glacial and fluvial depositional systems. Many marine aggregate resources are relict deposits that were formed during times when the sea level was much lower than present. During these periods large parts of the sea bed were exposed, glaciated or crossed by major river systems. Most relict sand and gravel deposits are related to a combination of major deltaic river systems, formed in periglacial conditions that prevailed before the last major ice age, and glacial sediments related to late Pleistocene major glacial events. These glacial events provided an abundance of coarse-grained sediment from glaciofluvial meltwaters and morainic deposits and scoured major channels into what is now the sea bed, some of which later filled with aggregate minerals. More modern marine sand deposits (gravel is generally only mobilised by the most extreme sea bed currents in the modern marine environment) are formed from tidal currents and wave action re-working and sorting sand into semi-mobile banks and sand waves.

Figure 9  Marine Sand & Gravel resource and licence areas in the UK in 2014.

(a) Slurry etc. recovered from dumps, ponds, rivers etc.
(b) Marketable product (KCl).
(c) Including ethane, propane and butane, in addition to condensates.
(d) Dry weight.
(e) Excluding a small production in Northern Ireland.
(f) BGS estimates based on data from producing companies.
(g) Slate figures include waste used for constructional fill and powder and granules used in industry.
(h) BGS estimate.
(i) Including marine-dredged landings at foreign ports (exports).
(j) Excluding a small production of granite in Northern Ireland.
(l) Contains estimate related to Northern Ireland production.

Figure 10  Explanation of the layout of information in the DMQ, Part 1.
Directory of Mines and Quarries 2014

The following list includes all mineral operations known to have been working in 2014. This inevitably includes some that have ceased operations subsequent to the date of the surveys, which were carried out between December 2013 and April 2014. The mineral workings are arranged primarily in alphabetical order of the main commodity produced and subsequently in order of Regions and Mineral Planning Authorities.

Remote subsidiary sites are shown indented below their parent.

The names of lithologies worked or handled in the operation are given, where known, as is the rock type, the age and the name of the formation. In Quaternary materials, the different formations may be distinguished by a numerical suffix, e.g. River Terrace Deposits, 3 (River Blackwater Gravel) and if known by an alternative or previous name, this is given in brackets.

The BGS Lexicon of Named Rock Units can be found here: http://bgs.ac.uk/Lexicon/

Wharfs and rail depots, oil and gas wells, and plants producing desulpho gypsum are listed in this section with as much information as is known.

A number of sites are listed here which recycle aggregates. This is not a full list of such depots, but in the main they are either former quarry sites which are now producing secondary aggregate, or quarry sites where recycling takes place alongside primary aggregate production.

**Notes:** Marine Sand & Gravel

- Marine Sand & Gravel is a type of aggregate that is typically used in construction projects. It is derived from marine deposits and is often used for its durability and strength.

- The deposits are typically associated with coastal areas and are often found in sandy beaches or in the water itself.

- Marine Sand & Gravel is often used as a base material for roads, foundations, and other construction projects.

- The quality of the material can vary depending on the location and the specific marine deposits used.

- It is important to consult with local authorities and suppliers to ensure that the correct type of material is used for a specific project.

Alphabetical list of operators

The following pages comprise an alphabetical list of mineral operators, their addresses, telephone and facsimile numbers together with their respective operations, when known. Subsidiary operators are listed under the Parent operator where known, indented. In general the main office address of the operator, and appropriate sub-office, is given together with the address of each mineral working. However, where operators have only one operation only one address may be given. Where a mineral working has no permanent telephone or facilities for receiving mail, the appropriate part of the entry is, in general, omitted or curtailed.

Note: some site extensions and satellites may not be listed in this section.
Aberdeenshire Council, Harlaw Road, INVERURIE, Aberdeenshire, AB51 4TE, Tel: 01467 627518, Fax: 01467 627513
